

BASEDEFENSE⁺

HARDENER: DRY SHIELD

GRIND HONE

The first line of Green Umbrella Base Defense™ is Green Umbrella Dry Shield™. Increases hardness, while reducing porosity. Requires no rinsing & disposal and will not gel on surface — can be allowed to air dry. Stands up to heavy abrasion and foot traffic while providing excellent slip resistance. Has the

highest abrasion resistance. Due to being pH neutral Green Umbrella Dry Shield™ does not interfere with the application of concrete dyes as sodium products can. Decreases black tire marking from lift trucks and other equipment.

PENETRATING TREATMENT: MICROFILM

POLISH

The added protection that makes you shine. Green Umbrella Microfilm™ is an environmentally friendly hybrid surface treatment that creates a durable micro-thin layer to seal polished concrete. After polishing to completion, at

least a 400 grit GUr, apply Green Umbrella Microfilm™ to form a breathable, dense, protective layer which is highly resistant to oils, stands up to acids and chemical exposure, and is not prone to whitening, peeling or flaking – with a beautiful high gloss finish. Testing results prove superior chemical resistance to some of the harshest chemistries a facility floor will face. It is the repairable layer to the Green Umbrella Base Defense Treatment System™ in case burnishing would not remove etching, simply reapply.
