Polish

Indoor

A good team is a team whose strengths complement one another, a good team plays well together. It is important that chemistry and colorants applied to concrete follow that same principle. Concrete treatments that complement one another; coupled with the proper mechanically ground, honed, and polished floor can create a winning combination for your polished concrete needs. The **Green Umbrella Max Defense Treatment System with Color™** is comprised of at least 3 concrete treatments. **Green Umbrella ColorDeep™**, a combination of coloring and densifying that saves you time and money. **Green Umbrella Shield & Enhance™** has water repellence and a superior chloride screen. Substitute **Green Umbrella ColorDeep™** with **Green Umbrella Dry Shield™** and have your color delivered through **Green Umbrella ColorFlash™** for areas where immediate drying is necessary or multiple color patterns are required. Or with another player, **Green Umbrella ColorDense™**, for a UV stable color that will be exposed to direct sunlight for long periods of time. To finish off the line up **Green Umbrella Microfilm™** offers a repairable surface layer, making **Green Umbrella Max Defense Treatment System with Color™** the defense that has you covered.

Reference – ASTM D-1308
 Testing was completed on 1 cubic inch concrete samples that had been treated with a three-part protocol using Dry Shield, Shield and Enhance and Microfilm (or RTU Microfilm). Each cube was completely immersed in the respective chemicals for 48 hours. No visually perceptible changes occurred in any sample surface texture or appearance (color). Chemical Resistance to:

JP-8+100 fuel	●	0.1%	weight gain
30wt Motor Oil	●	0.007%	weight gain
Skydrol 500 B-4	●	0.05%	weight gain
