Green Umbrella Color Fusion Treatment System™ is the fusion of a UV stable color hardener, **Green Umbrella Color Shield™**, with the increased durability of **Green Umbrella Microfilm™**, set on a simplified Grind and Hone cut substrate prepped with specially designed **GUF** abrasives. The **Color Fusion** cut is achieved with as few as one specialized, economical **GUF1** abrasive that creates a soft blended look. The initial cut may be followed by the **GUF 2** to close off concrete as needed. If a higher gloss is desired, for maximum hone use the **GUF3**. The result is an eye appealing concrete floor that has a unique fusion look. **Green Umbrella Color Fusion Treatment System™** offers a budgeted option when compared to a full GHP(Grind-Hone-Polish) cut. Additionally, it can be used in a restoration where concrete variables like high moisture present color challenges that cause SB(Solvent Based) dye to fade. The low cost, easy application, color fastness, chemical resistance of **Green Umbrella Color Shield™** with the added durability of **Green Umbrella Microfilm™** makes this a treatment system that is hard to beat.
